

EduProva — Database Price Comparison

Single-table reference. Approximate prices from the supplied comparison PDF. Actual billing varies by region, storage, I/O, backups, replicas, traffic and capacity.

Database	Model	Pricing Model	Monthly USD	Monthly INR	Entry / Example	Best Use	Cost Position
DynamoDB	NoSQL	Requests / capacity + storage	\$0–10+	■0–870+	On-Demand / Provisioned	Key-value / massive scale	Lowest potential entry
MongoDB Atlas	Document	Cluster tier + storage	\$0–60+	■0–5,200+	M0 Free → M10 Dedicated	JSON / document workloads	Low → high by tier
RDS MySQL	Relational	Instance + storage + I/O	\$13–15+	■1,100–1,300+	db.t4g.micro	Traditional MySQL	Traditional SQL
RDS PostgreSQL	Relational	Instance + storage + I/O	\$13–15+	■1,100–1,300+	db.t4g.micro	Standard SQL / transactions	Traditional SQL
Aurora MySQL	Relational	Compute + storage + I/O	\$50–60+	■4,300–5,200+	db.t4g.medium	High-performance MySQL / HA	Managed HA
Aurora PostgreSQL	Relational	Compute + storage + I/O	\$50–60+	■4,300–5,200+	db.t4g.medium	High-availability PostgreSQL	Managed HA

EduProva takeaway: RDS PostgreSQL has a much lower starting compute price than Aurora PostgreSQL in this reference. MongoDB Atlas can start at \$0 on the M0 free tier, while production tiers are charged. Always compare total workload cost, not only the database instance price.
