

EduProva — Database Pricing Comparison

Compact reference • two useful tables per page

Database	Model	Pricing Approach	Cost Position
DynamoDB	NoSQL	Requests / capacity + storage	Lowest potential entry
MongoDB Atlas	Document	Cluster tier + storage	Low → high by tier
RDS MySQL	Relational	Instance + storage + I/O	Traditional SQL
RDS PostgreSQL	Relational	Instance + storage + I/O	Traditional SQL
Aurora MySQL	Relational	Compute + storage + I/O	Managed HA
Aurora PostgreSQL	Relational	Compute + storage + I/O	Managed HA

Pricing note: Actual billing varies by region, storage, I/O, backups, replicas, traffic and capacity.

1. Aurora PostgreSQL

Instance / Tier	vCPU	RAM	Monthly Compute*	INR*	Recommended Use
db.t4g.micro	2	1 GiB	\$13–15	₹1,100–1,300	Learning / testing
db.t4g.small	2	2 GiB	\$25–30	₹2,200–2,600	Development
db.t4g.medium	2	4 GiB	\$50–60	₹4,300–5,200	Small applications
db.r6g.large	2	16 GiB	\$175–200	₹15,200–17,400	Small production
db.r6g.xlarge	4	32 GiB	\$350–400	₹30,400–34,800	Medium production
db.r6g.2xlarge	8	64 GiB	\$700–800	₹60,900–69,600	Large production
db.r6g.4xlarge	16	128 GiB	\$1,400+	₹1.22L+	Enterprise

2. Aurora MySQL

Instance / Tier	vCPU	RAM	Monthly Compute*	INR*	Recommended Use
db.t4g.medium	2	4 GiB	\$50–60	₹4,300–5,200	Learning / development
db.t4g.large	2	8 GiB	\$100–120	₹8,700–10,400	Small applications
db.r6g.large	2	16 GiB	\$175–200	₹15,200–17,400	Small production
db.r6g.xlarge	4	32 GiB	\$350–400	₹30,400–34,800	Medium production
db.r6g.2xlarge	8	64 GiB	\$700–800	₹60,900–69,600	Large production
db.r6g.4xlarge	16	128 GiB	\$1,400+	₹1.22L+	Enterprise
Aurora Serverless	Auto	Auto	Usage-based	Usage-based	Variable / unpredictable

Aurora = compute + distributed storage + I/O + backup.

3. Amazon RDS PostgreSQL / MySQL

RDS MySQL and RDS PostgreSQL use the same reference chart here.

Instance / Tier	vCPU	RAM	Monthly Compute*	INR*	Recommended Use
db.t4g.micro	2	1 GiB	\$13–15	₹1,100–1,300	Learning / testing
db.t4g.small	2	2 GiB	\$25–30	₹2,200–2,600	Development
db.t4g.medium	2	4 GiB	\$50–60	₹4,300–5,200	Small applications
db.t4g.large	2	8 GiB	\$100–120	₹8,700–10,400	Small production
db.r6g.large	2	16 GiB	\$175–200	₹15,200–17,400	Medium production
db.r6g.xlarge	4	32 GiB	\$350–400	₹30,400–34,800	Large production
db.r6g.2xlarge+	8+	64 GiB+	\$700+	₹60,900+	Enterprise

4. DynamoDB

Capacity Model	Billing Basis	Approx. Cost	Recommended Use
On-Demand	Pay per request	Usage-based	Development / unpredictable traffic
Provisioned	Read + Write capacity	Usage-based	Predictable production workload
Provisioned + Auto Scaling	Capacity automatically adjusts	Usage-based	Production with changing traffic
On-Demand + Global Tables	Requests + replicated regions	Higher usage-based cost	Multi-region applications
DAX	Separate cache cluster	Additional cost	Very low-latency read-heavy workloads

DynamoDB is usage-based rather than RAM/CPU tier based.

5. MongoDB Atlas

Cluster Tier	Type	RAM	Storage	Monthly USD	Monthly INR	Recommended Use
M0	Shared	Shared	512 MB	\$0	₹0	Learning, testing
M2	Shared	Shared	2 GB	\$9	₹780	Development
M5	Shared	Shared	5 GB	\$25	₹2,150	Small applications
M10	Dedicated	2 GB	10 GB	\$60–70	₹5,200–6,100	Small production
M20	Dedicated	4 GB	20 GB	\$120–140	₹10,400–12,200	Medium production
M30	Dedicated	8 GB	40 GB	\$250–300	₹21,700–26,100	Large production
M40	Dedicated	16 GB	80 GB	\$500–600	₹43,500–52,200	Enterprise
M50+	Dedicated	32 GB+	160 GB+	\$1,000+	₹87,000+	High-scale enterprise

6. All Database Approximate Price Comparison

Rank	Database	Model	Starting Monthly	INR	Pricing Model	Best Use
1	DynamoDB	NoSQL	\$0–10+	₹0–870+	Requests/capacity + storage	Massive key-value
2	MongoDB Atlas	Document	\$0–60+	₹0–5,200+	Cluster tier + storage	JSON/document
3	RDS MySQL	Relational	\$13–15+	₹1,100–1,300+	Instance + storage + I/O	Traditional MySQL
4	RDS PostgreSQL	Relational	\$13–15+	₹1,100–1,300+	Instance + storage + I/O	Standard SQL
5	Aurora MySQL	Relational	\$50–60+	₹4,300–5,200+	Compute + storage + I/O	High-performance MySQL
6	Aurora PostgreSQL	Relational	\$50–60+	₹4,300–5,200+	Compute + storage + I/O	High-availability SQL

Low → High: DynamoDB / MongoDB Atlas → RDS MySQL / PostgreSQL → Aurora MySQL / PostgreSQL

7. Decision Guide

Cost Level	Databases	Meaning
Lowest potential	DynamoDB / MongoDB Atlas	Free or low-usage tiers can make entry cost very low
Traditional SQL	RDS MySQL / RDS PostgreSQL	Managed relational database with familiar SQL
Managed HA SQL	Aurora MySQL / Aurora PostgreSQL	Higher-end managed architecture with distributed storage / HA

8. Selection Checklist

Criteria	Primary Consideration
Features	Data model, scaling, transactions and database capabilities
Security	Encryption, authentication, network isolation, IAM/RBAC and auditing
Latency	Application/database proximity, indexing and connection pooling
Workload	Document, relational, transactional or key-value access pattern
Cost	Compare total workload cost, not only instance price

EduProva recommendation: MongoDB Atlas remains the current fit for the document-oriented application. Aurora PostgreSQL becomes attractive when a strongly relational and transactional module requires it.

Final rule: Features + Security + Latency + Workload + Cost should be evaluated together.
